

01 Project Information

Sri Gowtham Model School

TRAFFISENSE AI

An Automated AI & IoT System for Smart Traffic, Emission & Noise Monitoring

02 Theme

Smart Mobility, Road Safety, and Environmental Protection.

03 Swarna Andhra Sutra(s)

Sutra 6-Global Best Logistics, Sutra 9-Swachh Andhra, and Sutra 10-Deep Tech. TAFFISENSE uses AI-based monitoring to detect over-speeding, reckless driving, excessive vehicle smoke, and noise pollution. It promotes safer and more efficient transportation, supports a cleaner environment, and demonstrates the application of AI and deep technology to urban traffic and public safety challenges.

04 What is the Problem?

Heavy Vehicle Smoke & Neglected Engines Vehicle owners skip engine oil maintenance, emitting toxic smoke and carbon particulates on city roads.
 Illegal Silencers & Noise Pollution Aftermarket modified silencers create deafening noise, disturbing residential and hospital zones.
 Over-Speeding & Reckless Driving Excess speed leads to fatal accidents, while existing manual checks fail to monitor roads 24/7
 Inefficiency of Manual Traffic Checking Traffic police cannot manually inspect every smoking or speeding vehicle on busy highways.

05 What is Your Proposed Solution?

AI Optical Smoke Detection: Road-side AI cameras powered by Computer Vision analyze the density and color of exhaust smoke emitting from vehicles in real-time.

Multi-Sensor Traffic Pole: Combines Speed Radar, Decibel Noise Sensors, and Optical Smoke Density Sensors mounted on road gantries to monitor vehicle parameters simultaneously.

Automated Penalty System: When emission or speed limits are breached, ANPR captures the license plate and instantly alerts Traffic Police and the vehicle owner via SMS.

Step-by-Step Working Mechanism: Automated Sequence from Vehicle Entry to Penalty Trigger

01 Vehicle Entry Vehicle passes through the Smart Pole Monitoring Zone on highway or road. DETECT

02 Multi-Scan AI Camera & Sensors Scan Smoke Level, Noise Decibels & Radar Speed.

03 Limit Check Microcontroller compares values against permissible legal limit thresholds.

04 ANPR & Alert If exceeded, ANPR captures plate, generates proof & sends SMS e- Challan.

Component Description	Cost (INR)
Raspberry Pi 4 Microcontroller	₹4,500
HD Wide Angle Camera Module	₹1,500
MQ-135 Gas & Sound Sensor Kit	₹800
Radar Speed Measurement Sensor	₹1,200
GSM Module & Battery Unit	₹1,500
TOTAL ESTIMATED PROTOTYPE COST	₹9,500 Approx.

06 Additional Information (Optional)

Hardware Components	Software Stack
AI Camera (ANPR) Captures HD photos of license plates and visual smoke	Python & OpenCV Real-time video processing and smoke analysis
MQ-135 / Optical Gas Sensor Measures carbon particulate density in exhaust	Tesseract OCR / ANPR Automatic Number Plate Recognition algorithm
Radar Speed & Acoustic Sensor Detects vehicle velocity and illegal silencer noise	IoT Cloud Server Stores violation logs and vehicle records safely
Raspberry Pi 4 / GSM 4G Module Edge processing microcontroller with cloud connectivity	Twilio / RTO Gateway API Triggers instant e-challan SMS to vehicle owners
